### **What's New in the SIM Manager?**

The SIM Manager software is a Java application which uses all Sim knowledge and options to verify the validity of the information you enter and to keep records. When you first run the program, you should connect to your SIM card reader. Then you should select the information you want to see (SIM, IMEI, serial number, date of expiry etc.) and choose a location for all this information. SIM Manager uses a zigzag map to show you the location and the corresponding SIM. You can click on it to open a window which shows you the most accurate and up to date information available on your SIM card. The program is organized into two sections. The first one is the contacts screen, which is the equivalent to a SIM card, and the

second is the settings page, where you can modify the various settings of your SIM. In the contacts screen, the most important information is shown in the bottom left corner. You should use this screen to find all the relevant information to know how your SIM card and devices work. For instance, you can see the IMEI, if you want to know your mobile device's number. All the numbers you should input in the SIM screen are prefilled in this screen (aside from the SIM type, the country and the date of expiry). When a new device is added, the software automatically fills out this information when the SIM is removed and inserted in the device. When SIM is no longer used, your device's location in the SIM manager gets transferred to the contacts screen. SIM Manager settings The Settings page gives you more details about your SIM card. This page contains two sections: general and license. The first one includes the phone number, code, network, country, date of expiry and IMSI code. In the license section, the information is detailed about the mobile number (subscription, etc.) and its expiry date. SIM manager automatically updates your contact data and adds a print button to the SIM information screen in order to keep a backup of this information. You can also assign your SIM to a device and make changes to all the information you can see on the contacts screen. SIM Manager can be used on Windows 10, 8, 7, Vista, XP and ME. An account is not required to use SIM Manager, so you can download it in the internet and install it. This software is free for use, so it is completely legal. SIM Manager Benefits: • Works with Windows XP
